AUTHORS: Gulevskaya, A.S., Lipatova, V.A., Tel'd, P.V.

TITLE: Heat conductivity of Fe and Si alloys containing  $\beta$ -leboite

PERIODICAL: Referativnyy zhurnal. Metallurgiya, no. 1, 1962, 48, abstract 11336  
("Tr. Ural'skogo politekhn. in-ta", 1961, no. 114, 90 - 95)

TEXT: Heat conductivity of alloys containing 40 - 100% Si was measured by A.P. Ioffe's method, which was modified for the use of 12-18 mm<sup>2</sup>-section specimens. The heat contact is assured by melting the ends into Sn. Heat-conductivity isotherms (20°C temperature) were plotted for commercial alloys whose leboite  $\beta$ -modification was p-conducting, and pure alloys with n-type conductivity. In spite of a substantial difference of the electron energy spectrum, heat conductivities of both series of specimens were merely slightly different. As far as the heat conductivity observed was a sum of phononic and electronic heat conductivities, the conclusion is drawn that the former is of predominant importance. The author studied the effect of admixtures to  $\beta$ -leboite up to 1 weight % Al; the addition

TITLE: Nondestructive determination of <sup>1</sup>As in ores and minerals containing high  
amounts of Mn by means of neutron activation analysis

SOURCE: Chemicke zvesti, no. 12, 1965, 918-924

TOPIC TAGS: neutron radiation, analytic chemistry, gamma spectrometer, scintillation  
spectrometer

ABSTRACT: The authors describe a method that may be used in the presence of above  
1% of Mn without subjecting the sample to a radiochemical treatment; the samples  
are irradiated for 20 minutes by a stream of neutrons in a nuclear reactor. They  
are left standing for 70 hours so that interfering radiocompounds would be  
decomposed, and then As is determined by using a 400 channel scintillation gamma  
spectrometer. Sensitivity is  $5 \cdot 10^{-6}$  grams, accuracy  $\pm 15\%$ . Orig. art. has:

"Thermoregulatory Processes in Obesity."

Prague, Casopis Lokaru Ceskych, Vol 105, No 22, 3 Jun 66, pp 600 - 601

Abstract: Heat exchange between the organism and the surroundings was investigated in obese and normal people. The investigations were made at room temperature at 25°C in 123 people, in a bath at 38°C in 54 people, in a cold bath at 25°C in 36 people, and in cool air at 15°C in 52 people. Under all of these conditions differences in heat exchange between obese and normal people were found. In cold surroundings obese people show lower skin temperatures than normal people, and as a result they show lower metabolic heat losses. In hot media the heat absorption in obese people is delayed for a longer period than in normal people. The layer of fat acts as insulation under all conditions. 5 Western, 3 Czech references.

1520. TELEGDI L., TÓTH E., GOLDBERGER A. and TEGE A. Allami Gyermek-szanat. Primér the osztályának közleménye, Szabadsághegy. \*Adatok a tuberculosos gyermekek anamnesiséhez. Report on the history of tb children ORV. HETIL. 1956, 97/6 (153-155) Graphs 5

The following has been concluded from the history of 1000 children with tb, and 100 children mistakenly admitted into the sanatorium (age 3-14):- (1) The children were infected at a preschool age, and at an early school age in an equal proportion. (2) The number of children vaccinated with BCG was not greater among those who lived in an infected environment, than among those infected from unknown sources. (3) Children from an infected environment who were not vaccinated became ill in the 6th to 12th months, but the majority of the vaccinated children became ill after 3-4 yr. (4) The diagnosis before admission was based on general symptoms, which was responsible for the mistakes. (5) In about half of all cases the new disease process was revealed by symptoms, in the other half the disease displayed no symptoms, or otherwise passed unobserved. (VII, 15\*)

from a mixture of ethyl chloride and gaseous hydrogen chloride

SOURCE: Academia scientiarum hungaricae. Acta chimica, v. 45, no. 1, 1965, 31-36

TOPIC TAGS: silane, chemical synthesis

ABSTRACT: Experimental evidence has been gathered to show that the interaction of  
trichlorosilane and ethyl chloride results in the formation of trichloroethylsilane.  
This reaction plays an important role in the direct synthesis of ethylchlorosilanes  
from a gaseous mixture of hydrogen chloride and ethyl chloride. Orig. art. has:

AUTHOR: Telegdi, Marianna

TITLE: Isolation of crystalline alpha-glycerophosphate dehydrogenase (L-glycerol-3-phosphate: NAD oxidoreductase 1.1.1.8) from rabbit muscle

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 25, no. 2, 1964, 177-180

TOPIC TAGS: biochemistry, rabbit, muscle physiology, organic phosphorus compound, myology

ABSTRACT: A new method has been developed for the isolation and crystallization of alpha-glycerophosphate dehydrogenase from rabbit muscle. The preparation was shown to be homogeneous chromatographically. The yield was better and the specific activity was about 8 times greater than that of the best preparations described previously. "The author is greatly indebted to Prof. F. B. Straub for his continuous interest in this study, and to Mrs. M. Szegvari for valuable technical assistance." Orig. art. has: 1 table.

AUTHOR: Telegdi, Marianna; Keleti, Tamas

TITLE: Role played by sulfhydryl groups in the activity of alpha-glycerophosphate dehydrogenase (L-glycerol-3-phosphate: NAD oxidoreductase 1.1.1.8)

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 25, no. 2, 1964, 181-189

TOPIC TAGS: biochemistry, rabbit, muscle physiology, myology, enzyme, organic phosphorus compound

ABSTRACT: [English article, authors' English summary modified] The  $\alpha$ -glycerophosphate dehydrogenase isolated from rabbit muscle contains 9-11 SH groups per molecule of protein. When the SH groups are blocked by PCMB, the reaction catalyzed by the enzyme is inhibited in both directions. For complete inactivation, 6-7 SH groups must be blocked. The inhibition of the enzymatic activity is caused by the blocking of the SH groups, it is instantaneous and can be reversed by cysteine. This process is followed by the al-

9

teration of the steric structure, a time consuming reaction which can only partly be reversed by cysteine and which results in a decreased ability of reactivation. Under certain conditions, the enzyme can undergo spontaneous inactivation accompanied by the disappearance of some of its free, titratable SH groups. This inactivation can not be reversed by cysteine.

"We are indebted to Prof. F. B. Straub<sup>44,55</sup> for valuable suggestions and to Mrs. M. Szegvari<sup>44,55</sup> for skillful technical assistance." Orig. art. has: 3 graphs, 2 tables.

REPORT ON EXPLORATIONS OF COAL DEPOSITS IN THE KOMLÓ AREA OF HUNGARY IN THE YEARS 1936 TO 1943. K. Telegdi-Roth. (bányászati és kohászati Lapok, 1948, vol. 6, June, pp. 161-169). (in Hungarian). Exploration work in the Komló area was started in 1936 and test borings were started the following year with deep-boring equipment suitable for bores to a depth of 800 m. The test bores were 407 to 874 m deep and details of the most important ones are given in the paper. The exploration work covered an area of 4,685,000 sq. m., and the average layer thickness of the coal deposits discovered was 10 m. The available coal deposits in this area are estimated at approximately 30 million tons and this is sufficient to permit an output of 600,000 tons/annum for 50 years.—E.G.

718. THE EFFECT OF PROGESTERONE TREATMENT AND CASTRATION  
ON ADRENAL CORTICAL SECRETION - Telegy G. and Endrőczy  
E, Inst. of Physiol., Med. Univ., Pécs - ACTA PHYSIOL. ACAD. SCI.  
HUNG, 1959, 16/1 (23-25) Tables 1

In dogs treated with progesterone for 7 to 12 days adrenal cortical secretion and also the ratio of hydrocortisone to corticosterone showed a significant rise. After castration, the resting secretion measured under general anaesthesia was definitely lower than in the controls. No sex differences were noted either in the progesterone-treated or in the castrated series.

Abstract: [Author's Hungarian summary] Various structures of pig ovarian tissue were investigated by a paper chromatographic method for their progesterone content. Yellow body tissue of more than 5 mm diameter contained 5.1 micrograms of progesterone per gram, of less than 5 mm diameter contained 0.39 micrograms per gram, and follicles at various stages of development, without yellow bodies, contained 0.09 micrograms per gram. AUTHOR: Fendler, Kornel; Telegdy, Gyula; Endrocsi, Elemér

TITLE: Effect of chronic stress on the oxytocic and antidiuretic activity of the hypophysis in the rat

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 24, No 3, 1964, 287-292

TOPIC TAGS: albino rat, hypophysis, hypophyseal oxytocic activity, hypophyseal antidiuretic activity, chronic stress, hypothalamic-hypophyseal system, hydration

ABSTRACT: Female albino rats were forced to swim daily until total exhaustion, over a period of 29 days. The animals were divided into groups and were examined at 3- to 4-day intervals for changes in the hypophyseal oxytocic and antidiuretic activities. The oxytocic activity of the rats forced to swim showed a slight decrease on the 6th and 8th days of swimming, followed by

Card 1/2

ACCESSION NR: AT4035344

a considerable increase on the 12th and 15th days. This four-to seven-fold increase (as compared with the control values) reached the maximum on the 18th day, the declined gradually on the 22nd and 29th days, but did not return to the initial level during the period of observation. Pituitary antidiuretic activity showed an increase in the animals forced to swim under the above experimental conditions. Orig. art. has: 2 figures.

TITLE: Estimation of adrenal function in vivo and in vitro: comparison of the two methods of assay in rats treated with ACTH 22

SOURCE: Academiae scientiarum hungaricae. Acta physiologica, v. 28, no. 2, 1965, 133-137

TOPIC TAGS: rat, ACTH, endocrinology, corticosteroid

ABSTRACT: The effect of i.p. injection of 3 IU/100 g doses of ACTH on the adrenal corticosteroid secretion of the rat has been studied in vivo and in vitro 30, 60, and 90 minutes after their administration. At 30 minutes, following the injection of ACTH the corticosterone content of the adrenal venous blood was found to be 33 per cent higher; at 60 minutes, 48 per cent higher; at 90 minutes, 49 per cent higher than in the controls. The corticosterone production by the removed adrenal was at 30 minutes 59 per cent higher, at 60 minutes 19 per cent higher, and at 90 minutes 4 per cent higher than the control values. Effects of certain additives used in the food industry on the activity of lipase. The effect of synthetic dyes on the activity of lipase was studied.

The use of synthetic dyes in the food industry has increased in the last few years. The same properties of some of the aniline dyes was pointed out as far back as 1880, however no investigations were undertaken to explain the effects of these substances. In the present experiments the change of surface tension in a solution of tributyrin saturated by the action of lipase was measured by stalagmometric methods to determine the lipase activity. The determinations were repeated five times and according to the experimental results the lipase activity was influenced in different ways by various approved dyestuffs. Flavazine R, Indigo carmine, Induline B, Naphthol yellow S, Nigrosine WL and Tartrazine O proved to have an activating effect whereas Brilliant green SP, Bordeaux R, Orange LRR, Rhodamine B, Tropaeolin 000 and Neococcine definitely inhibited the enzyme activity, and even total inactivation set in when Orange LRR was added. Generally the dyes which decrease the surface tension have an inhibitory effect on the enzyme activity whereas those which increase the surface tension have an activating influence. This phenomenon seems to verify that the surface tension decreases as a result of the accumulation of certain dyestuffs at the interface.

Relations between the chemistry of the and organic  
chemistry  
Vol. 10, 1955, No. 3, p. 100-101

Most of the data on the reaction of the  
with the organic compounds  
is in the literature  
and is not in the  
present volume.  
The present volume  
contains the data  
on the reaction of the  
with the organic compounds  
which is not in the  
literature.
